Senior Infrastructure Automation Engineer | Simplesense

Cover letter

Hi Simplesense team,

The part of this role that caught my eye was making facility onboarding repeatable. I like the work between “we got it running” and “someone else can set it up, check it, and fix it without calling me.” That was a big part of my job at Front Range Internet and it is still how I build at Technomancy IT.

At FRII, I ran NOC operations, built tooling for our operators and hosting customers, and migrated workloads from Hyper-V and VMware ESXi to Docker and Kubernetes. When an issue made it past the NOC, I had to figure out where it broke and give the team a way to handle it next time. Earlier, at Office Evolution, I built a provisioning system around a custom Linux routing device, putting each office in its own VLAN and automating parts of the setup.

I still build those checks into my own tools. My deployment workflow tags images from Git and checks both container health and the public endpoint. The backup check goes a step further: it restores PostgreSQL into a disposable instance and checks that the tables are there. I’d bring that same attention to provisioning, validation and handoff on your Connectivity team.

Thanks,
Chad Koslovsky
